

Prepared for the Arizona Interagency Coordination Group

By: Mike Fisher Fire Management Specialist Bureau of Land Management

Abstract

Two course-scale 1-km resolution (subdivided to 250m), spatial data layers of Arizona was produced to support statewide level fire management planning. The Wildland Urban Interface layer represents places at risk with the influence of structure density. The Land Hazard layer represents places at risk when considering only the landscape hazard.

This paper documents the spatial model components used in the assessment. Managers can use the spatial data for state level fire planning.

Background

Nationally, there is increasing concern over threats to communities by wildfires. Wildland fire is a common natural disaster in Arizona, with approximately 3,737 occurring annually and consuming 163,417 acres. The increasing growth of Arizona's rural populations, urban sprawl, and increasing wildland fuel loads ads to create a mix of situations that is known as the wildland urban interface (WUI).

Fire managers have been using Geographic Information Systems (GIS) as a tool to help assess various fire management issues. GIS allow fire managers to analysis spatial data such as slope, aspect, fuels, fire density, condition class, and housing density, as it relates to the wildland urban interface. The Arizona assessment uses GIS as a tool to analyze the WUI issue on a statewide basis.

The Wildland Urban Interface has been identified by various methods throughout the state of Arizona by various agencies. The Arizona WUI Assessment project is an attempt to conduct an analysis on a statewide basis using a common spatial model. The assessment was to validate those communities listed in the federal register and further identify possible other communities at risk.

The technologies required already exist and most of the data sets are available. This methodological study of the wildland-urban interface identified, mapped and quantified risk and hazards facing rural populations from wildland fires

The Arizona Interagency Coordination Group in cooperation with Arizona State Lands
Department requested a WUI assessment be conducted. This project is a joint effort of Arizona
State Land Department – Fire Management, USFS, BLM, NPS, FWS and BIA.

Assessment

The Wildland Urban Interface assessment is a statewide strategic report. The findings from the WUI assessment indicate areas that are at a low, moderate or high potential to be impacted, when a wildfire occurs. Data layers utilized in this assessment are course in scale. Results should not be interpreted down to an acre-by-acre basis. The assessment results provide indicators to managers on where more detailed assessments should take place.

This assessment uses technologies such as aerial imagery and geographic information systems to identify and map the risk posed by wildfire to residences in the wildland-urban interface. The WUI spatial model produces the data themes of wildfire risk, topography, fire hazard, and structure density. When combined, these themes produce a model of wildfire risk to residences in Arizona. It also indicates areas that should mitigate for wildfire hazards when development occurs. The data themes can be updated as more detailed and timely information becomes available.

The greatest influence on defining the urban interface problem, is where is there significant number of structures (HOUSE) and where there are fuel hazards. (HAZARD). These are the two factors in which we have the greatest influence over. We can decide where to put structures and how many. We can also alter the fuels around the structures and the condition of the fuels.

Approach

The WUI assessment uses four main data layers comprised of Risk, Hazard, Topography and House Density to assess the wildland urban interface issue for Arizona.

TOPO -

• Aspect and Slope derived from 30 meter Digital Elevation Model (DEM) data from USGS.

Risk -

• Historical Fire Density using point data from fire record years 1986-1996 from all wildland agencies.

Hazard -

• Fuels, natural fire regimes and condition class.

House -

House / Structures

A value rating of 1-15 was used for all layers. Weighing percentages were determined through discussion with the Arizona Interagency Coordinating Group.

The assessment for the Wildland Urban Interface model utilized the following formula:

WUI = (HOUSE*35%)+(HAZARD*35%)+(RISK*20%)+(TOPO*10%)

Slope	TOPO	
Aspect	1000	
Fuels		
Fire Regimes	Hazard	VA/LII
Condition Class		WUI
Fire Density	Risk	
	Houses	

GIS Metadata

- Projection: NAD27 Zone 12
- Grid data was converted to 250 meter cell size for all layers.

TOPO

- TOPO theme was derived from 30m DEM USGS data for Arizona using aspect and slope.
- A weighted layer of: TOPO = (Aspect*40%) + (Slope*60%), was used to create the TOPO theme.

Aspect

- Aspect is considered to have a lesser influence on fire behavior than slope.
- Aspect was reclassify the into four directions (North, South, East, West)

Aspect	Label	Grid Designation	
0-45	North	15	
45-135	East	12	
135-225	South	6	
225-315	West	9	
315-360	North	15	

- Generally, fuel loadings are the greatest on north slopes and are the site is wetter, followed by East and then West. The fuel loading is the lightest and the driest sites are on the South facing aspects.
- Aspect is used in this model to help in influencing fuel loading based changes with aspect.
- A 1-15 value spread was utilized to be consistent with other theme layers.

Slope

- Reclassify the grid into five slope classifications
- Basic fire behavior modeling has for every 10-degree of slope adds 1 mile per hour to the Rate of Spread of the fire.
- As a general fire behavior rule for every 10% slope, 1mph is added to the rate of spread of the fire.

Slope	Label	Grid Designation
0-10	Flat – Slight	3
10-20	Mild	6
20-30	Moderate	9
30-40	Steep	12
+40	Extreme	15

By combining Aspect and Slope theme though a weighted formula of (Aspect*40%) + (Slope*60%) = TOPO.

Slope was given the higher weight due to its greater influence on fire behavior during worst case fire conditions.

Risk (Fire Density)

- A simple density calculation through spatial analysis was used to create the fire density theme.
- Fire records from 1986 through 1996 of State and Federal wildland agencies were used.
- A 11 mile search radius was set
- All fire causes were used.
- Size of fire was not considered.

Fire History data:

	Person	Person	Lightning	Lightning		
(By State)	Caused	Caused	Caused	Caused	Total	Total
	Fires	Acres	Fires	Acres	Fires	Acres
	(PCF)	(PCA)	(LCF)	(LCA)	(TF)	(TA)
ARIZONA						
1992	2,353	33,770	1,603	7,836	3,956	41,606
1993	3,719	117,049	1,016	87,725	4,735	204,774
1994	2,469	40,793	2,110	182,106	4,579	222,899
1995	3,318	119,366	1,526	125,397	4,844	244,763
1996	1,747	89,916	2,033	98,271	3,780	188,187
1997	1,500	8,962	1,302	9,585	2,802	18,547
1998	2,317	43,432	916	7,718	3,233	51,150
1999	1,416	50,605	1,795	31,675	3,211	82,280
2000	1,407	45,657	2,172	37,239	3,579	82,896
2001	1,820	12,762	1,347	17,741	3,167	30,503
2002	1,833	599,383	1,385	30,493	3,218	629,876
Average	2.173	105,609	1.564	57.799	3.737	163,407

Hazard Theme

The Hazard theme is a composite of Fuels, Fire Regime and Condition Class.

The three themes (Fuels, Fire Regimes, and Condition Class) where added through a weighted option.

HAZARD = (FUELS*50%) + (Fire Regime* 25%) + (Condition Class* 25%)

This resulted in a HAZARD theme with a possible 0-15 classification.

Fuels

- Arizona GAP analysis vegetation communities were classified into NFFL fuel models.
 - The fuels map has not been field validated in all areas.
- The fuels theme was converted to 250m grid data.
- Large fires (Dude, Aspen, Rodeo, Bulleck, Chedisky, etc), which have changed the fuels, were not taken into account in developing the fuels layer.
- Fuels projects, which have been completed, that have modified fuels around communities were not taken into account within the development of the fuels layer.
- Fuel models were assigned a grid value on a scale of 1-15, based on the potential fire behavior of that model as it relates to risk to structures.
- Urban, Water and Agricultural areas were assigned a zero rating.
- Identified Urban, water and agricultural areas in the fuels layer were used to in the fire regime and condition class layers to identify the same.

NFDRS	Fire Behavior Fuel Models (NFFL)						
Fuel Model				•			
	1	2	3	4	6	8	9
A (western annuals	Χ						
U (open pine /grass)		Х					
T (Sagebrush		Х					
/ grass)							
N (sawgrass – arrowweed)			X				
B (Mature Brush 6ft)				X			
F (Intermediate					Х		
Brush)							
H (Fir)						Х	
U (Closed Pine)							X

NFFL Fuel Model	Grid Value
1	03
2	05
3	07
4	11
6	13
8	09
9	15
Non fuel (water/agriculture/urban)	00

Fire Regimes

- Fire Regime data theme was derived from a national assessment completed by the Rocky Mountain Research Station.
- Fire regime data was converted to 250m grid data.
- Fire regimes were set to a scale of 1-15.
- The more frequent fire cycles were given the higher grid value.
- The urban, water, industrial and agriculture areas identified in the GAPVEG layer were clipped and added into the fire regime and condition class layers. This was to add consistency between the fuels, fire regime and condition class layers.

Fire Regime	Grid Value
0-35 yrs Stand Replacement	15
0-35 yrs Low Severity	13
35-100 yrs Stand Replacement	10
35-100 yrs Mixed Severity	8
200+ Stand Replacement	5
Non Fuel (Water/agriculture/urban)	0

Fuel Condition Class

- Condition Class was derived from a national study completed by the Rocky Mountain Research Station.
- Condition Class was converted to 250m grid data.
- The urban, water, industrial and agriculture areas identified in the GAPVEG layer were clipped and added into the fire regime and condition class layers. This was to add consistency between the fuels, fire regime and condition class layers.
- The worst condition class areas were assigned the highest value. The more closely an area is to CC1 the more natural the fuel loading is expected to be.

Condition Class	Grid Value
Condition Class 3	15
Condition Class 2	10
Condition Class 1	5
Non Fuel (Water/agriculture/urban)	0

House

The housing layer was developed off of the land status map. DOQQ's where utilized to determine if the land status polygon contained little to no structures, rural setting, medium or high number of housing. Other themes such as the USGS names, place names, towns were utilized to assist in locating populated areas. No attempt was made to count number of structures within a polygon. A visual determination was made and a rating applied.

- The house theme does contain the 100+ communities identified in the federal register as well as over 700 other places.
- Boundaries of places are not the legal boundaries. In some cases smaller communities were placed under a larger community's name.
- DOQQ's utilized were from three to seven years old. Current structure density may be greater where new development has occurred.
- 898 places / communities where identified in the house theme.
- Census data was reviewed. It was determined that the census blocks and tracts where no detailed enough for use in the rural areas of Arizona.

Wildland Urban Interface

The final outcome of the WUI model utilizes a formula of:

WUI = (HOUSE*35%)+(HAZARD*35%)+(RISK*20%)+(TOPO*10%)

This resulted in a data layer with values in a scale of 1-15. This layer was further reclassified into high, medium and low risk.

The resulting output from the spatial model provides managers with a method of which to prioritize treatment areas and identify areas that should obtain more detailed assessment. It does not prioritize with a category.

Reclassification Label	WUI point value	
High	10-15	
Moderate	7-9	
Low	1-6	

It is important to remember the influence of structures. Areas of high structure density rated higher than areas of scattered structures. That does not mean the scattered structures are not at risk. The model placed more importance in addressing high structure density areas before lower density areas.

One of the results of the model is some communities or places that were originally listed as high on the federal register list fell in rating. This is due to the influence on the house density layer to help assess priorities on where to start to address the WUI issue. Those structures existing in high fire danger areas are still at risk. The land hazard assessment more closely matches the federal register list.

Land Hazard

An additional assessment was conducted to answer the question of what the landscape would rate out without the influence of structures. It more simply can be stated as, what is the hazard of the landscape?

The same spatial data was utilized that was developed for the WUI assessment. The formula was changed to:

The result is a map that indicates areas of low risk if a structure existed to areas of high risk if a structure was place in the landscape. This layer can be used to address the potential risk to any structure, independent of the size of the community.

The Land Hazard model more closely represents the list of communities from the Federal Register list. This is because many agencies did not consider weighing structure density. They inventoried and assessed if the structure was at risk.

Conclusion

The Wildland Urban Interface assessment described in this paper successfully provided managers with a state level assessment of the wildland urban interface issue. The spatial model provided two methods to look at the Wildland Urban Interface issue.

- The Wildland Urban Interface assessment which is weighted by the structure density
- Land Hazard assessment which is independent of structure density and assesses only the lay of the land and fuels.

The methodology used could be applied to finder scale data. It can modified to include other influencing inputs such as fuel treatments, or protection capabilities of an area.

Wildland Urban Interface Assessment Results

Federal Register List

The following table represents the assessment on the 2001 federal register listed places/communities. Because the assessment was done along ownership blocks, there is a multiple rating for some communities. The higher rating should be used to determine the assessment of the communities. The multiple rating is the result of different rating factors. The greatest influence is the housing and hazard layers.
